

Journal Strategy for Paper 1

From Declarative Policy to Executable Governance: Emotional Infrastructure Telemetry for Longitudinal AI Interaction

Submission Strategy Overview

The strongest initial pathway is a CEITR-aligned internal submission or research review because the paper is directly relevant to AI in education, instructional technology, and responsible technology governance. CEITR describes itself as focused on technology-based tools, learning theories, and instructional strategies in K-12, higher education, and corporate settings, and its AI Research Group is dedicated to advancing understanding and use of AI in education.

The strongest external journal pathway is AI and Ethics, AI & Society, or Big Data & Society. AI and Ethics is aligned because it explicitly focuses on ethical, regulatory, and policy implications arising from the development of AI. AI & Society is aligned because it focuses on the design, use, management, and policy of information and communication technologies and their social, cognitive, economic, ethical, and philosophical implications. Big Data & Society is aligned because it publishes interdisciplinary work on the societal implications of data-intensive technologies.

The paper should be submitted first through CEITR or an internal academic research pathway if the goal is institutional validation and research positioning. External journal submission should follow after manuscript expansion, deeper literature integration, and formatting according to target journal instructions.

Recommended Targets

1. CEITR / University of Phoenix AI Research Group

Fit: High. This is the best first validation path because the manuscript aligns with AI in education, instructional technology, and governance. It should be positioned as a contribution to responsible AI use in higher education and technology-mediated learning environments.

2. AI and Ethics

Fit: High. This journal is a strong external target because the manuscript addresses ethical, regulatory, and policy implications of AI through an operational governance architecture. The strongest submission angle is executable AI governance.

3. AI & Society

Fit: High. This journal is a strong external target because the manuscript addresses the social, cognitive, ethical, and policy implications of information technology. The strongest submission angle is socio-technical governance infrastructure for adaptive AI systems.

4. Big Data & Society

Fit: Medium-high. This journal is relevant because EIT addresses data governance, platform accountability, and auditability. The manuscript would need stronger social-science

framing before submission.

5. ACM FAccT or CHI-adjacent venue

Fit: Stretch. These venues may be appropriate after the work includes a prototype, evaluation, or user study. The strongest future angle would be technical governance and human-AI interaction accountability.

Revision Priorities Before External Journal Submission

Expand the literature review to 20 to 30 sources, including work on algorithmic accountability, AI ethics implementation, human-AI interaction, data protection, socio-technical systems, and internal auditing.

Add a formal figure showing the EIT pipeline, including consent validation, LIL, TAR, PDEV, and audit logging.

Add a concise table mapping EIT components to regulatory and governance functions.

Add a limitations section that clearly states the paper is a design framework and has not yet been empirically validated through large-scale deployment.

Prepare a separate data availability and ethics statement if required by the target journal.
