

Dear Editor,

Please consider the manuscript titled "From Ethical Principles to Executable Governance: Emotional Infrastructure Telemetry as a Policy Translation Layer for Longitudinal AI Interaction Systems" for publication as a conceptual and standards-oriented contribution to AI governance, algorithmic accountability, and socio-technical infrastructure research.

The manuscript develops Emotional Infrastructure Telemetry as a deterministic governance architecture for longitudinal AI interaction. Its contribution is to translate high-level governance obligations into implementable protocol logic through consent validation, interaction logging, trajectory signal rules, proportional response selection, and audit traceability. The revised version includes a formal EIT pipeline figure, an expanded literature review with 20-30 sources, clear limitation boundaries, protocol-level pseudocode, schema examples, a traceability matrix, and test vectors.

The manuscript does not claim empirical validation or coverage of model training data, compute governance, model weight security, or frontier capability control. Its stated scope is the deployed interaction layer where AI systems use longitudinal context and where users require consent boundaries, explanation, contestability, and reviewable audit evidence.

This manuscript is original work and is not under consideration elsewhere. The author has no conflicts of interest to disclose.

Sincerely,

Brittany Wright
